### July 2022

- 152 studies included
- Evidence for the **clinical performance** of many test brands scarce or lacking
- Lack of well-designed prospective and comparative evaluations of different test brands in **clinically relevant settings** - **symptomatic and asymptomatic testing**
- Lack of reporting of **symptoms** or symptom duration
- All used nucleic acid amplification as the **reference test**

The UK, therefore, did, on average, 22 tests per person, similar to Denmark and Austria. However, the UK identified fewer reported cases, meaning the number needed to detect one case is far higher, NND= 62.

Compare the total cases per million population to the tests used for the same population

## Abstract

### Background

We aimed to review the evidence from studies relating severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) culture with the results of reverse-transcription polymerase chain reaction (RT-PCR) and other variables that may influence the interpretation of the test, such as time from symptom onset.

The data suggest a relationship between the time from onset of symptom to the timing of the specimen test, cycle threshold (Ct), and symptom severity.

Twelve studies reported that Ct values were significantly lower and log copies higher in specimens producing live virus culture.

Two studies reported that the odds of live virus culture were reduced by approximately 33% for every 1-unit increase in Ct.

## PCR Testing in the UK During the SARS-CoV-2 Pandemic – Evidence From FOI Requests

Jefferson T,<sup>1</sup> Dietrich M,<sup>2</sup> Brassey J,<sup>3</sup> Heneghan C,<sup>1</sup>  
(Version 1, 2 February 2022)

The number of validated tests in use in the UK is currently not clear:

Public Health England (PHE) report it may be “80” or “85”.

European regulations suggest there could be **over 400** different CE marked tests available.

Only two FOI responses provided answers on Ct values, indicating that in a set time span, **24–38%** of the Ct values were over 30.

The most common FOI asked if there was a cycle threshold for positivity. In those that responded, the Ct for a positive result varied from **30 to 45**.

**Conclusion:** The current system requires significant changes to ensure it offers accurate diagnostic data to enable effective clinical management of SARS-CoV-2.

PCR is an important and powerful tool, but its systematic misuse and misreporting risk undermining its usefulness and credibility.

Jefferson T,<sup>1</sup> Dietrich M,<sup>2</sup> Brassey J,<sup>3</sup> Heneghan C,<sup>1</sup>

## **A Hierarchical Framework for Assessing Transmission Causality of Respiratory Viruses**

Tom Jefferson <sup>1,\*</sup>, Carl J. Heneghan <sup>2</sup>, Elizabeth Spencer <sup>2</sup>, Jon Brassey <sup>3</sup> , Annette Plüddemann <sup>2</sup>, Igho Onakpoya <sup>1</sup>, David Evans <sup>4</sup>  and John Conly <sup>5</sup>

Systematic reviews of 591 primary studies of the modes of transmission for SARS-CoV-2 show significant methodological shortcomings and heterogeneity in the design, conduct, testing, and reporting of SARS-CoV-2 transmission

We attempted to address the translational gap between the current research evidence and the assessment of causality in the transmission of respiratory viruses with a focus on SARS-CoV-2.

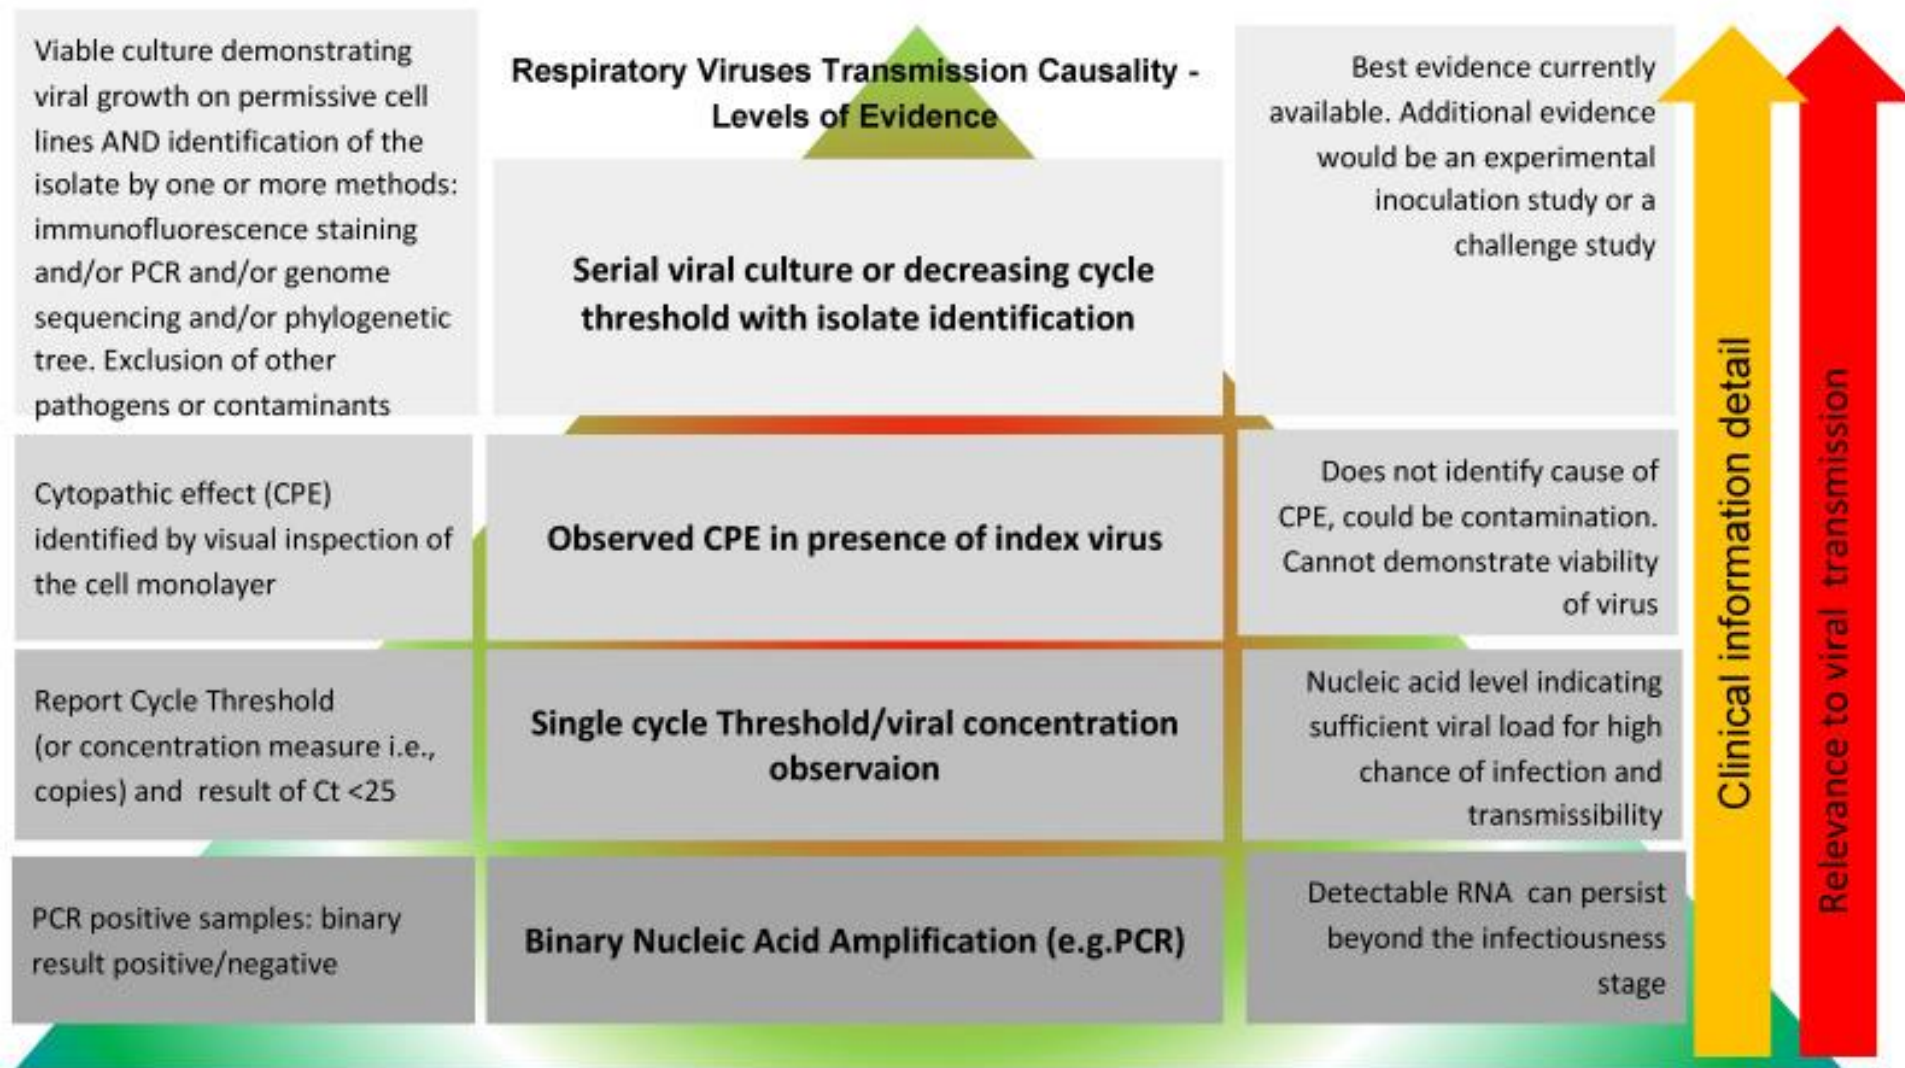

Table 6

Virological and genomic evidence reported in 591 studies included in five systematic reviews of transmission of SARS-CoV-2. Key: Ct = cycle threshold; CPE = cytopathic effect.

Review	Primary Studies	PCR Result (% of Studies)	Ct (% of Studies)	Ct < 25 (% of Studies)	Attempted Viral Culture (% of Studies)	CPE (% of Studies)	Genome Sequencing (% of Studies)	Serial Viral Culture Positive (% of Studies)
Airborne Transmission [10]	127	53 (79.1%)	51 (40.2%)	5 (3.9%)	26 (20.4%)	5 (3.7%) <sup>1</sup>	6 (4.7%)	3 (2.3%) <sup>2</sup>
Fomite Transmission [11]	63	51 (81.0%)	13 (20.6%)	3 (4.8%)	11 (17.5%)	0	0	0
Orofecal Transmission [9]	77	46 (59.7%)	22 (28.6%)	7 (9.1%)	6 (7.8%)	1 (1.3%) <sup>3</sup>	1 (1.3%)	0 <sup>3</sup>
Close Contact Transmission [12]	258	163 (73.7%)	26 (10.1%)	6 (2.3%)	4 (1.6%)	2 (0.6%)	18 (5.8%)	2 (1.2%)
Vertical Transmission [13]	66	66 (100%)	9 (13.6%)	2 (3.0%)	0	0	1 (1.5%)	0
(% of primary studies)	591	379 (64.1%)	121 (20.5%)	23 (3.9%)	48 (8.1%)	9 (1.5%)	26 (4.4%)	5 (0.85%)

<sup>1</sup> Some studies observed presumed virus-induced CPE. <sup>2</sup> Two studies detected other viruses, all studies had methodological limitations. <sup>3</sup> CPE did not show plaques and is not immunostained.

# Levels of evidence for proof of the microbiological and clinical aspects of transmission of a viral respiratory pathogen

## Evidence-based approach to testing?

- Evidence for testing as important as evidence for treatment
- Repository of tests / strategy to evaluate tests
- Evidence in the setting
- Appropriate outcome of interest

Understanding the problem from a range of perspectives, with a particular emphasis on evidence, and using and interpreting data

- Most importantly, go back to the source of the evidence surrounding a claim.
- Critically appraise the evidence, considering the outcomes, the level of evidence, and the biases.
- Understand the limitations in the evidence in relation to the importance of the outcome to patients.
- Integrate the evidence with experience, expertise and the available resources

If the evidence isn't high-quality, then ask why we are not improving the quality of the research.
